

Nicole Davi

Nicole (Nikki) Davi is a professor of Environmental Science at William Paterson University and is an affiliated scientist at Columbia University's Lamont-Doherty Earth Observatory. She studies past climate patterns using tree rings, which act like natural records of environmental change. Her research, funded by the National Science Foundation and NOAA, helps us understand how climate has varied hundreds to thousands of years ago, from centuries-long droughts to coastal storms to long-term warming trends, and how those changes have affected ecosystems and the people who depend on them. She also collaborates with artists to find new ways of communicating science to broad audiences.
