

January 2023 Tennessee State Climate Summary

Tennessee Climate Office * East Tennessee State University

Prepared by William Tollefson and Dr. Andrew Joyner

With contributions by [Climate Data Representatives](#) across the state

Monthly Temperature Summary:

January was much warmer than normal across Tennessee, with the majority of the state recording a mean temperature that was 4-8°F above the 1991-2020 30-year climate normals for the month. Three counties in northwest Tennessee, Lake, Obion, and Dyer, all recorded their warmest mean temperature for the month of January. The month started out on a warm note, with most areas reaching into the mid-70's on the first three days of January. Chattanooga and Jackson set daily high temperature records on January 2, with Nashville tying their daily high temperature record, and on January 3 Knoxville and the Tri-Cities set daily high temperature records. The first week of the month averaged 12-15°F warmer than normal across most areas of the state. While later weeks in the month were not as extreme, the warmer than normal pattern continued. Another notable warm spell occurred January 17-19, with Jackson setting and Memphis tying daily record highs on the 18th, and Chattanooga and the Tri-Cities setting daily record highs on the 19th. Looking at all stations with at least a 30-year reporting history, there were 35 broken daily high temperature records, and 17 broken records for warmest daily low temperature this month. The weather station at Monterey set a monthly record for warmest low temperature ever recorded in January.

KINGSPORT	COOP	40.1

Monthly Precipitation Summary:

Most areas of the state recorded above normal precipitation for January 2023, with the western half of the state generally seeing the most above normal precipitation totals. Southwestern portions of Haywood County recorded over 250% of their normal precipitation for the month. This wet pattern started out in the first week of the month, with almost all of West Tennessee recording more than double their normal rainfall for the week. The heavy rainfall shifted to East Tennessee for the second week of the month with over 2" of rain in the mountains and northern Tennessee Valley. The mountains also received heavy snowfall in the middle of the month, with up to a foot of snow recorded across the highest elevations. Precipitation totals were not as high in the second half of the month, but frequent light rain occurred across the state. At the very end of the month, freezing rain, sleet, and a little snow impacted West and Middle Tennessee, with ice storm warnings and winter weather advisories being issued on January 31. Throughout the month there were 34 records set for largest daily precipitation, with just over half set in the first week of January.

54 of 351 stations in the state reported measurable snowfall and an additional 64 reported a trace of snow this month.

The Month in Comparison:

Comparing the mean temperature and total precipitation for January 2023 to the mean temperature and precipitation for January over the past thirty years from selected automated weather stations at airports across the state, it was warmer and wetter than average. This January was the second warmest of the past thirty years at the Nashville, Chattanooga, and Bristol/Tri-Cities airports, behind only January 2017 at each location. However, looking at the longer weather history for each city it was the 5th warmest January recorded for the Tri-Cities (with a 76-year station history), Nashville tied for the 8th warmest January in the city's 149-year weather history, and it was not a top-ten warmest January for Chattanooga. It was the third warmest January of the past thirty years at the Memphis and Jackson airports, and the 4th warmest of the past thirty years at Knoxville's airport, but again it was not a top-ten warmest January for these cities when looking at their full weather histories. For precipitation, it was also the second wettest January of the past thirty years for the Memphis airport, trailing only 2013. It was the 14th wettest January in Memphis's 145-year weather history.

January 2023 Tennessee State Climate Summary

Drought Monitor:

In the last U.S. Drought Monitor of December 2022, there was a small area of Moderate Drought (D1) in western Lauderdale County, and northern parts of West Tennessee, and some northwestern Middle Tennessee counties were in Abnormally Dry Conditions (D0). Rain and snow at the end of December and beginning of January helped to clear those areas, with the D0 removed and the area of D1 improving to D0 in the Drought Monitor from January 3, 2023. In the January 10 release of the Drought Monitor, all of Tennessee was clear of drought or abnormally dry conditions, and remained so for the rest of January. This was the first time since late March 2022, that the state was clear on the U.S. Drought Monitor.

U.S. Drought Monitor Class Change - Tennessee 4 Week

Soil Moisture:

Plentiful rainfall helped to increase soil moisture levels across the state this month. The NASA SPoRT Land Information System shows that there are still some areas of below normal soil moisture in West Tennessee and northern Middle Tennessee, where they are likely still catching up from the Fall drought. These areas also saw the largest increases in soil moisture during January, with most of the region having a 12-16% increase in relative soil moisture levels. The USDA Crop Progress report rated topsoil moisture across the state as 1% short, 63% adequate, and 36% surplus; subsoil moisture was rated as 2% short, 73% adequate, and 25% surplus.

Streamflow:

January streamflow was also up, with most USGS stream gauges in Tennessee reporting streamflow in the normal range, with a few streams reporting above normal flow for the month.

Map of monthly streamflow compared to historical streamflow for the month of the year (Tennessee)

January 2023

Explanation - Percentile classes							
Low	<10	10-24	25-75	76-90	>90	High	Not-ranked
	Much below normal	Below normal	Normal	Above normal	Much above normal		

Miscellaneous:

Crop Conditions from USDA: The cold snap in late December did damage to some winter wheat and pasture grasses across the state. At the end of January, 15% of the state's winter wheat crop and 34% of the state's pasture and range were reported in poor or very poor condition, 36% of hay and roughage supplies were also reported as low or very low. Cattle were mostly in fair to good condition though. The wet pattern for January brought new problems for pasture and fields, with many producers fighting mud and standing water.

Fire Danger: The Interagency Fire Center outlook for significant wildland fire potential shows all of Tennessee and surrounding regions with a normal potential for fires in February.

Story of the Month:

The main weather and climate stories of January 2023 were the ice storm that impacted the western half of the state in the final days of the month and the record-setting warmth that occurred earlier in the month.

Ice Storm: Despite the overall warmer than normal pattern across Tennessee this month, there were a few cool spells sending temperatures into the teens or twenties for most weather stations across the state. One of these cold spells overlapped with several rounds of precipitation moving through the region and produced freezing rain, sleet, and some snow in the last days of January through the first of February. This prompted ice storm warnings and winter weather advisories to be issued for West Tennessee, Middle Tennessee, and most of the Cumberland Plateau. An ice storm warning was issued for all counties in West Tennessee, and northwestern counties of Middle Tennessee on January 31. And reports of 0.1-0.2" of ice accumulation were common throughout West Tennessee, and Trenton, TN in Gibson County reported 0.42" of ice accumulation from January 30-February 2.

Snow and ice cover Memphis and the Mid-South in the early evening on Tuesday, Jan. 31, 2023. Slush, ice and snow accumulate at Crosstown Concourse
RAY PADILLA

Warmth: As noted in the monthly temperature summary there were 34 daily weather records set for the warmest high temperature and 17 daily weather records set for warmest low temperatures recorded at weather stations across Tennessee this month. Additionally, Monterey recorded the warmest low temperature ever observed in the month of January, with a 127-year weather history. They only got down to a low of 63°F on Jan 3, 2023 breaking the previous record of 62 set on Jan 8, 1943.

Notable warm periods included January 1-4 and January 17-19. On January 2, Jackson, with a 73-year weather history, set record warm high and low temperatures, and Chattanooga, with a 142-year weather history, set a record daily high temperature, while Nashville, with a 149-year weather history, tied its record for warmest high temperature on that date. Memphis, with a 148-year weather history also set a record warm low temperature on January 2. On January 3 the Tri-Cities airport, with a 76-year weather history, and Knoxville, with a 151-year weather history, set record highs for the day. On January 18, Jackson set another daily high temperature record, and Memphis tied their record high for the date. Then on January 19, Chattanooga and the Tri-Cities set daily high temperature records.

Storm Reports:

**Storm Reports are based on filtered NOAA Storm Prediction Center data or local NWS storm reports. Future quality control checks may change the official record of severe events, please see spc.noaa.gov for any updates.*

There were three days with severe storm reports during January 2023, with a total of 4 tornadoes, 33 reports of severe wind damage, and 6 reports of severe hail (with a diameter of 1" or larger). There was one report of an injury caused by severe storms this month.

CPC Outlooks for the Next Month:

The NOAA Climate Prediction Center outlook for February shows that all of Tennessee is leaning towards a warmer than normal month, with 40-50% likelihood. Tennessee is also leaning towards a wetter than normal February, with the western half of the state having a 50-60% chance of a wetter than normal February while the eastern half has a 40-50% likelihood of a wetter than normal February.
